The capacity of low-income Connecticut households to pay their home energy bills deteriorated in 2009, while the federal energy assistance program designed to help pay those bills falls far short in its ability to stem the tide of home energy unaffordability. The discussion below reviews the Home Energy Affordability Gap in Connecticut in 2009. The data and analysis leads to the following conclusions:

- The Home Energy Affordability Gap in Connecticut, which represents the dollar amount by which actual home energy bills exceed affordable home energy bills, is substantial; is statewide, affecting both urban and rural areas of the state; and is increasingly affecting households that have traditionally been considered moderate income.
- The federal fuel assistance program, known as the Low-Income Home Energy Assistance Program (LIHEAP), covers a fraction of the home energy costs for a fraction of the income eligible population.
- Low-income households do not have the discretionary income to absorb energy bills that are not offset by public or private assistance programs;
- The increasing unaffordability of home energy places other non-energy household necessities at risk, including most notably the affordability of overall shelter costs.

Each of these conclusions is considered in more detail below.

## **THE HOME ENERGY AFFORDABILITY GAP IN CONNECTICUT**

The State of Connecticut has a large and growing Home Energy Affordability Gap facing its low-income households. Available resources are grossly insufficient to address this affordability gap. As a result of this mismatch between energy bills and the resources needed to pay them, many low-income households incur unpaid bills and experience the termination of service associated with those arrears. In addition, the paid-but-unaffordable bill is a real phenomenon in Connecticut. Even when low-income households pay their bills in a full and timely manner, they often suffer significant adverse hunger, education, employment, health and housing consequences in order to make such payments.

Energy prices have placed a substantial burden on the public and private energy assistance agencies in Connecticut. Current home heating, cooling and electric bills in Connecticut have driven the average *per-household* Home Energy Affordability Gap for households living with incomes at or below 185% of the Federal Poverty Level (FPL) to crushing levels. The average annual shortfall between actual and affordable home energy bills for households at or below 185% of FPL now reaches over \$2,550 per household. The aggregate Home Energy Affordability Gap in Connecticut now reaches nearly \$585 million statewide.

This \$585 million is *not* the total low-income home energy bill in Connecticut. Rather, the \$585 million is the Affordability Gap, the dollar amount by which actual home energy bills exceed affordable home energy bills.

The Affordability Gap differs by geographic region within the state. The aggregate Home Energy Affordability Gap will differ by factors that include the heating degree days (HDDs) and cooling degree days (CDDs); the number of low-income households and the poverty level at which those households live; the type and size of housing unit; the mix of heating fuels (e.g., natural gas, electricity, fuel oil); and other similar factors.

The appendices attached to this report present Connecticut’s annual Home Energy Affordability Gap from three perspectives:

- Appendix A presents the Home Energy Affordability Gap for each state legislative district (House) in Connecticut;
- Appendix B presents the Home Energy Affordability Gap for each state legislative district (Senate) in Connecticut; and
- Appendix C presents the Home Energy Affordability Gap for each Congressional district in Connecticut.

In contrast to these detailed statistics, the narrative discussion below highlights different aspects of the Home Energy Affordability Gap. The detailed statistics for each legislative district, however, can be obtained from the relevant appendices.

While the Home Energy Affordability Gap varies somewhat based on geography within the state of Connecticut, there can be no question but that the Affordability Gap is a statewide phenomenon. This fact can be seen, for example, by comparing the aggregate Affordability Gap in each Congressional District in Connecticut. The annual statewide Affordability Gap of \$585 million is split nearly evenly over each of Connecticut’s five Congressional Districts. While the distribution of the Affordability Gap is not identical over Connecticut’s Congressional districts, it ranges from a low of 18% in the Fourth District to a high of 22% in the First and Third Districts. Congressional District #4, with the *smallest* Affordability Gap in Connecticut, nonetheless faces a Gap of nearly \$105 million.

**Total Home Energy Affordability Gap by Congressional District  
(Connecticut 2009)**

<b>Congressional District</b>	<b>Congressional Representative</b>	<b>Aggregate Shortfall</b>	<b>Percentage of Statewide Shortfall</b>
1 <sup>st</sup> District	Rep. John B. Larson	\$126,190,604	22%
2 <sup>nd</sup> District	Rep. Joseph Courtney	\$111,572,486	19%
3 <sup>rd</sup> District	Rep. Rosa L. DeLauro	\$127,368,400	22%
4 <sup>th</sup> District	Rep. James A. Himes	\$104,808,444	18%
5 <sup>th</sup> District	Rep. Christopher S. Murphy	\$114,669,465	20%
State Total		\$584,609,399	

The statewide nature of Connecticut’s Home Energy Affordability Gap can be seen in the state legislative districts as well. There are clearly some House legislative districts, for example, that

have a particularly large aggregate Affordability Gap. Districts such as House District #002, #019, #082, #086, #117 and #147 all have an Affordability Gap that is more than \$6.0 million. This is not surprising, since these districts have some of the most populated districts in the state.

The Connecticut Home Energy Affordability Gap, however, is not exclusively the province of these populated regions. Nine House Districts have 1,000 or fewer low-income households, but have an aggregate Home Energy Affordability Gap of more than \$2.0 million (Districts #081 (\$2.5 million); #085 (\$2.3 million); #091 (\$2.3 million); #113 (\$2.4 million); #121 (\$2.5 million); #128 (\$2.4 million); #137 (\$2.6 million); #145 (\$2.3 million); #150 (\$2.5 million)).

### **HOME ENERGY AFFORDABILITY GAP REACHES INTO MODERATE INCOME**

The *total* Home Energy Affordability Gap (for all households) is not the only concern presented in Connecticut. One additional cause for particular concern is the fact that the Affordability Gap is reaching increasingly into what historically has been seen to be more moderate income households. Home energy burdens (bills as a percentage of income)<sup>1</sup> now exceed the affordable level for households with income between 150% and 185% of the Federal Poverty Level in *every* Connecticut state House legislative district. Indeed, the home energy burden for households with income between 150% and 185% of the Federal Poverty Level now falls at twice the burden generally deemed to be “affordable” in every House district.

This impact is at income between 150% and 185% of Federal Poverty Level, the highest income level studied. This is significant because the home energy burden increases as household incomes decrease. Home energy burdens for households at lower Poverty levels will be substantially greater than twice the affordable level.

The Table below documents the growth in Connecticut’s Home Energy Affordability Gap since 2003. Note that while the dollar growth in the total Home Energy Affordability Gap is not substantially higher in the top two income tiers (125-149% and 150-185% of Federal Poverty Level), the *percentage* growth in the top two tiers is much higher. The reason is that increasing energy prices are pushing households at these income levels into the “unaffordable” range. While in the past, home energy bills to these households would have been affordable, and thus not contributed to the Home Energy Affordability Gap, at current prices, they *are* unaffordable and thus contribute to the Gap in a substantial way.

---

<sup>1</sup> A “home energy burden” is simply the ratio of the home energy bill to gross household income. A household with an annual income of \$8,000 and a total home energy bill of \$2,000, for example, has a home energy burden of 25% ( $\$2,000 / \$8,000 = 0.25$ ).

---

## Increase in Home Energy Affordability Gap by Federal Poverty Level (Connecticut)

---

	Aggregate Affordability Gap by Ratio of Income to Federal Poverty Level					
	Below 50%	50 - 74%	75 - 99%	100 - 124%	125 – 149%	150 - 185%
2003 annual /a/	\$89,625,061	\$35,306,332	\$34,515,064	\$33,713,227	\$30,208,168	\$31,157,758
2009 legislative /b/	\$166,559,203	\$71,908,175	\$75,425,577	\$81,077,097	\$82,450,346	\$107,189,001
Growth in Affordability Gap	\$76,934,142	\$36,601,843	\$40,910,513	\$47,363,870	\$52,242,178	\$76,031,243
Percentage growth	86%	104%	119%	140%	173%	244%

NOTES:

/a/ The annual 2003 Home Energy Affordability Gap was released in April 2004.

/b/the 2009 legislative Home Energy Affordability Gap analysis was performed in December 2009.

---

This growth in the Affordability Gap in the more moderate income ranges has significant policy ramifications for fuel assistance funding. As the Home Energy Affordability Gap expands “upwards” (to more moderate income households), the need to provide assistance expands “upwards” as well. The significance of this is two-fold:

First, if funding remains constant, when the number of households that must be served increases, fewer dollars are available on a per-household basis. This is true even though the per-household Affordability Gap in Connecticut has increased from year-to-year.

Second, the number of households in each range of Federal Poverty Level is not equal. Indeed, the number of households in each Poverty Level range increases as incomes increase. The Table below presents the number of Connecticut households in each range of Poverty Level as of the 2000 Census. There are:

- more households in the 75 – 99% range of Federal Poverty Level than in the 50 – 74% range;
- more in the 100 – 124% range than in the 75 – 99% range;
- more in the 125% - 149% range than in the 100 – 124% range; and
- more in the 150 – 185% range than in the 124 – 150% range.<sup>2</sup>

As the need for energy assistance expands into higher income households, in other words, there is a need to provide proportionately more energy assistance simply to remain even.

---

<sup>2</sup> While the last range is somewhat wider (35% rather than the 25% increments of previous ranges), there are nonetheless proportionately more households in the final range even taking into account this wider spread.

---

Poverty Households in Connecticut (2000 Census)

---

Poverty Level	No. of Households
Below 50%	50,652
50 – 74%	24,654
75 – 99%	28,261
100 – 124%	33,339
125 – 149%	37,727
150% - 185%	56,550

## HOME ENERGY BURDENS

The affordability of energy bills is measured by what is called a household’s “energy burden.” Energy burdens are simply the household energy bill as a percent of household income. If a household has a \$10,000 annual income and a \$1,000 home energy bill, for example, that household has an “energy burden” of 10%. The energy burdens of low-income Connecticut households show the problem that the public and private energy assistance programs are designed to address.

Energy burdens can be used to compute the Home Energy Affordability Gap for various geographic areas. The Affordability Gap is the dollar amount by which *actual* low-income home energy bills exceed *affordable* home energy bills, as measured by an affordable home energy burden.

Home energy is a crippling financial burden for low-income Connecticut households. Connecticut households with incomes of below 50% of the Federal Poverty Level pay more than 85% of their annual income simply for their home energy bill. Households living between 50% and 100% of the Federal Poverty Level pay, on average, between one-quarter and one-third of their annual income for their home energy bills.

The Table below presents Connecticut home energy burdens disaggregated by Federal Poverty Level for the years 2005 through 2009. While home energy burdens in Connecticut have not reached the levels experienced in 2007, when the state experienced dual spikes in prices for both

natural gas and fuel oil, they continue to evidence an upward trend since 2005. In each income range, Connecticut households were worse off in 2009 than they were one year earlier.

State Aggregate Home Energy Burdens by Ratio of Income to Federal Poverty Level and Year (Connecticut)					
Ratio of income to Federal Poverty Level	2005 /a/	2006 /a/	2007 /a/	2008 /a/	2009 /b/
Below 50%	62.0%	74.4%	99.7%	84.6%	86.2%
50 – 74%	24.8%	29.8%	39.9%	33.9%	34.5%
75 – 99%	17.7%	21.3%	28.5%	24.2%	24.6%
100 – 124%	13.8%	16.6%	22.2%	18.9%	19.2%
125-149%	11.3%	13.5%	18.2%	15.5%	15.7%
150 – 185%	9.3%	11.1%	15.0%	12.7%	12.9%

NOTES:

/a/ Annual Home Energy Burdens for Connecticut taken from annual Home Energy Affordability Gap published in April/May each year since 2003.

/b/ 2009 Home Energy Burden calculated for this special legislative Affordability Gap study (Connecticut).

Even setting aside the unusual pricing conditions in 2007, the continuing degradation in home energy affordability in Connecticut is evident from the above Table. Home energy burdens are 40% higher in 2009 than they were in 2005, even after taking into account increases in income.

### FEDERAL LIHEAP COVERAGE

Much of the burden for the Home Energy Affordability Gap facing Connecticut will fall on the private sector (should resources be there to address the problem). Funding for the federal Low-Income Home Energy Assistance Program (LIHEAP) has historically been grossly insufficient to meet the Affordability Gap, and is decreasing in its ability keep up with increasing energy prices.

A common misperception is that the dramatic increase in LIHEAP funding in Fiscal Year 2009 placed low-income households in much better position than they had experienced in previous years. In fact, however, the increase in 2009 LIHEAP funding does not quite return Connecticut households to the inadequate position they had experienced in 2002. The Table below presents the data. While LIHEAP covered 17.5% of the Home Energy Affordability Gap in 2002, providing \$35 million of energy assistance against an Affordability Gap of \$200 million, even with increased funding, LIHEAP covered only 16.4% of the Home Energy Affordability Gap in 2009, providing \$96 million against an Affordability Gap of \$585 million.

---

## LIHEAP and Connecticut's Home Energy Affordability Gap /a/

Affordability Gap Year	Total Home Energy Affordability Gap <sup>3</sup>	Regular Block Grant LIHEAP Allocation	LIHEAP Coverage Ratio
2002 <sup>4</sup>	\$200,793,319	\$35,045,798	17.5%
2009 <sup>5</sup>	\$584,609,399	\$95,782,640	16.4%
Increase	\$383,816,080	\$60,736,842	---

---

Even the relatively steady “LIHEAP coverage ratio” overstates the effectiveness of LIHEAP in keeping up with increasing home energy bills. The LIHEAP Coverage Ratios in 2002 and 2009 (17.5% and 16.4% respectively) might be construed to indicate that LIHEAP has maintained the Affordability Gap somewhat constant. Such a conclusion would be wrong.

In fact, as the Table above shows, while the LIHEAP Coverage Ratio has been returned to being constant with 2002 on a percentage basis, the *dollar level* of the Affordability Gap not covered by LIHEAP has dramatically increased. While the Connecticut Home Energy Affordability Gap increased by nearly \$385 million from 2002 to 2009, the LIHEAP allocation to Connecticut increased by only \$61 million. From 2002 to 2009, in other words, Connecticut's low-income households experienced an increased Affordability Gap of more than \$320 million not offset by increased LIHEAP allocations.

LIHEAP continues to be severely inadequate in Connecticut. Even with significant funding increases in 2009, LIHEAP covers a fraction of the Home Energy Affordability Gap for a fraction of income-eligible households.

### **BASIC FAMILY NEEDS BUDGETS**

The failure of federal fuel assistance to provide assistance that is sufficient to adequately respond to increases in home energy prices, coupled with small, or even negative, changes in household income for households receiving public assistance, leaves low-income Connecticut households vulnerable to the inability to provide basic household necessities such as food, clothing, energy and shelter.

Low-income households have insufficient income to increase their expenditures on home energy without compromising other basic household necessities. This inability can be seen through a comparison of household income to a Basic Family Needs Budget.

A Basic Family Needs Budget takes into account the entire range of household expenses, including housing, food, childcare, transportation, health care, necessities and taxes. To the extent that household income is insufficient to cover these basic expenditures, trade-offs must

---

<sup>3</sup> The total Home Energy Affordability Gap includes electricity and hot water usage.

<sup>4</sup> The annual Home Energy Affordability Gap looks at the immediately preceding year (so that actual prices as reported by DOE can be used). Accordingly, the 2002 Home Energy Affordability Gap was released in April 2003.

<sup>5</sup> The 2009 Home Energy Affordability Gap was prepared through a special study dated January 2010.

occur in what gets paid and what does not. A Basic Family Needs Budget varies based on both household size and household composition. Not only will a three-person family have a different budget than a two-person family, but a one-parent/two-child three-person family will have a different Basic Family Needs Budget than a two-parent/one-child three-person family.

The Table below shows the inadequacy of household incomes in Connecticut. Basic Family Needs Budgets<sup>6</sup> for four different family configurations were calculated, using different family composition and family size. Within Connecticut's metropolitan areas, the Basic Family Needs Budget for a one-parent/one-child family ranged from a low of 267% of the Federal Poverty Level (Waterbury) to a high of 384% of the Poverty Level (Stamford-Norwalk). Connecticut's rural areas had a somewhat lower Basic Family Needs Budget (267% of Poverty Level).

The Basic Family Needs Budgets of one-parent/two-child families were clustered more closely within the state, generally staying between 270% and 310% of Federal Poverty Level. A two-parent/one-child family has a somewhat higher Basic Family Needs Budget in Connecticut than a one-parent/two-child family, being generally, but not exclusively, clustered between 240% and 280% of Federal Poverty Level. Both the Danbury and the Stamford/Norwalk metro regions have a higher cost of living.

Finally, while the absolute dollar amounts of the Basic Family Needs Budget for a two-parent/two-child family are higher than the corresponding budgets for smaller families, the ratio of those incomes to the Federal Poverty Level are not significantly different. Families with income at 251% of Poverty Level in Waterbury, along with families at 257% of the Poverty Level in Norwich/New London, and 262% of Poverty Level in Hartford/West Hartford/East Hartford, are living with an income that would cover the Basic Family Needs Budget for a 2-parent/2-child family. In contrast, it would require an income of 277% of Poverty Level in Bridgeport, and 281% of Poverty Level in New Haven/Meriden to cover the Basic Family Needs Budget for a 2-parent/2-child family.

---

<sup>6</sup> Unless the context otherwise clearly shows, a "family" and a "household" are considered to be synonymous for purposes of this discussion.

**Basic Family Needs Budget in Dollars and Percentage of Federal Poverty Level  
by Geographic Area (2008) (Connecticut)**

NOTES:

/a/ FPL is the ratio of the basic family budget to 100% of the Federal Poverty Level for the particular household size. 100% of Federal Poverty Level in 2008 for a two-person household was \$14,000; for a three-person household was \$17,600; and for a four-person household was \$21,200. The most recent Basic Family Needs Budget data available is for 2008.

SOURCE: Economic Policy Institute, Basic Family Needs Budget Calculator.

The conclusions to be drawn from this data, *vis a vis* home energy unaffordability, are two-fold. First, Connecticut's low-income households do not have discretionary income that they can devote to paying increased home energy burdens. Without additional home energy assistance, if energy bills increase, whether attributable to increasing prices, severe weather, or some other cause, either those bills will remain unpaid or Connecticut's households will be called upon to make additional compromises in the provision of other household necessities.

Second, whether low-income energy bills get paid in a full and timely fashion is not a function of adequate (or appropriate) "budgeting" on the part of the household. No matter how well budgeted, for example, it is not possible for a low-income Connecticut household to stretch an income at 200% of Federal Poverty Level to pay increased home energy bills when the Basic Family Needs Budget reaches between 250% and 350% of the Federal Poverty Level.

The inability of low-income Connecticut households to meet these Basic Family Needs Budgets comes as no surprise. The Table below presents data on the median income of households by the

ratio of income to Federal Poverty Level. The data reported is for the years 2005 through 2008; 2009 median income data is not yet available. The median income is based on the mid-point of each range. For example, in 2005, half of all households with income below 50% of the Federal Poverty Level had income above \$4,216 while half had income below that dollar level. In 2007, half of all households with income more than 100 but less than 125% of Federal Poverty Level had income of more than \$14,000, while half had income less than that dollar amount.

Median Household Income By Ratio of Income to Federal Poverty Level (2005 – 2008)  
(Connecticut)

	Below 50%	50 – < 75%	75 – < 100%	100 – < 125%	125 – < 150%	150 – < 200%	200 – < 250%	250% and Above
2005	\$4,216	\$8,064	\$11,952	\$12,614	\$14,764	\$21,288	\$28,814	\$82,500
2006	\$1,370	\$7,236	\$11,062	\$15,000	\$17,018	\$24,000	\$29,680	\$87,042
2007	\$2,750	\$9,000	\$9,762	\$14,000	\$18,214	\$21,899	\$31,016	\$90,000
2008	\$4,708	\$8,400	\$10,716	\$14,314	\$18,050	\$23,000	\$31,197	\$92,162

Current Population Survey, Annual Social and Economic Supplement (annual).

Two observations stand out from the data on median income disaggregated by Federal Poverty Level. First, the median income of households below 250% of Federal Poverty Level is simply inadequate to meet Connecticut’s Basic Family Needs Budgets. These households consistently experience an absolute mismatch between household expenditures on basic needs and the income available to pay those expenses.

Second, the income in the lower ranges of Federal Poverty Level exhibit a substantial volatility, unlike higher income households. For all three income ranges below 100% of the Federal Poverty Level, median household income *decreased* in Connecticut in two of the four years studied. Overall, households with income between 75% and 100% of Federal Poverty Level had a lower median income in 2008 than they did in 2005. For the three income ranges between 100% and 200% of Federal Poverty Level, median income decreased relative to the previous year in at least one year of the four years studied. In contrast, for households with income greater than 200% of the Federal Poverty Level, median income increased in all four years studied.<sup>7</sup>

### IMPACT OF ENERGY PRICE INCREASES ON TOTAL COST OF LIVING

The impact of rising energy costs is most burdensome on the lowest income households. The Table below examines the income for households with various demographics by income for the years 2004 through 2008, the last year for which data is available. Median income in Connecticut grew 13.3% during that period, with households having wage and earnings income experiencing a roughly equal income growth, if not slightly greater (14.4% for households with income from wages and earnings). In contrast, households on Social Security experienced an

<sup>7</sup> In reviewing these numbers, remember that the Federal Poverty Level is not a static number. For example, 100% of Federal Poverty Level for a 3-person household in 2005 was \$16,090, while 100% of Federal Poverty Level for the same 3-person household in 2008 was \$17,600.

income growth of somewhat more (15.1%), while households with retirement income experienced a growth of 13.8%.

Households relying on public assistance, however, did not share this income growth, but instead experienced increasing hardship in the years 2004 through 2008. Connecticut households receiving public assistance income actually experienced a *decrease* in income of nearly twelve percent (-11.8%).

Income by Year (inflation adjusted) by Demographic Factor (Connecticut)						
	2004	2005	2006	2007	2008	Percent change (04 – 08) /a/
Median income	\$60,528	\$60,941	\$63,422	\$65,967	\$68,595	13.3%
Wage and earnings	\$46,709	\$48,188	\$48,769	\$51,178	\$53,456	14.4%
Social Security	\$10,510	\$10,689	\$11,209	\$11,673	\$12,098	15.1%
Retirement	\$17,466	\$17,691	\$17,946	\$18,418	\$19,876	13.8%
Public Assistance	\$4,351	\$3,927	\$3,697	\$3,676	\$3,837	(11.8%)

NOTES:

/a/ Numbers presented in parentheses are negative numbers.

In contrast to these changes in income, according to the U.S. Department of Labor’s “inflation calculator,” items that cost \$100 in 2004 would have cost \$113.98 in 2008, i.e., the cost of living increased 14%.

As can be seen, Connecticut households as a whole retained their purchasing ability relative to the increased cost-of-living from 2004 to 2008 (median income grew 13.3% while the cost of living increased 14%). Persons with wages and earnings, social security income, and retirement income all remained relatively stable relative to the overall cost of living. In contrast, households on public assistance income (public assistance) lost ground relative to their purchasing power between 2004 and 2008.

Home energy contributed in particular to the increasing cost-of-living during this time period. The U.S. Department of Labor measures the cost-of-living using the three-year period 1982 through 1984 as the base (Base=100). By June 2004, the Consumer Price Index for all urban consumers (“CPI-U”) for “all items” had increased to 189.4. In the time between June 2004 and June 2009, the CPI-U increased further to 214.5. The total increase in the CPI-U for “all items” from June 2004 to June 2009 was 25.1 points.

The importance of this “all items” figure lies in the comparisons it allows one to make with specific components of a household’s budget. In contrast to this 25.1 point increase for “all items,” from June 2004 through June 2009:

- Fuels and utilities (not including transportation) increased from 162.7 to 206.3 (*plus* 43.6);
- Fuel oil and other fuels increased from 153.3 to 224.7 (*plus* 71.4);
- Food (at home) increased from 186.9 to 215.0 (*plus* 28.1);
- Rent (of primary residence) increased from 210.9 to 249.4 (*plus* 38.5);
- Clothing decreased from 121.4 to 120.2 (*minus* 1.2).

This review clearly displays the disproportionately high increase in home energy prices as compared to increases in the price of other basic household necessities such as food, clothing and shelter. The price of fuel oil increased at roughly three times the rate that the price of “all items” did. The price of fuels and utilities (not including transportation) increased at somewhat less than twice that rate that “all items” did.

#### **IMPACT OF ENERGY PRICE INCREASES ON TOTAL SHELTER COSTS**

Housing affordability has a direct impact on the ability of Connecticut’s low-income households to be able to afford their home energy bills. As housing prices increase, low-income households are increasingly forced out of higher-quality, higher-priced homes into older, lower-quality, less-energy efficient homes.

While the affordability of housing prices improved relative to income for two-bedroom units in 2009 relative to 2006 in most, but not all, areas of Connecticut, overall housing remained unaffordable. Only in Colchester/Lebanon and Danbury did renters need to have income at a higher ratio of income to Federal Poverty Level to afford a two-bedroom unit in 2009 than they needed in 2006.

Nonetheless, as the Table below shows, throughout the state, between 45% and 60% of all renters (at all income levels) could not afford a two-bedroom unit. In Bridgeport, Danbury, New Haven/Meriden, Stamford/Norwalk and Waterbury, 55% or more of all renters (not merely low-income renters) could not afford a two-bedroom unit. Even in the regions of the state with the most affordable shelter costs (Colchester/Lebanon, Hartford, Milford/Ansonia/Seymour, Norwich/New London, Southern Middlesex County, Litchfield County, Windham, and non-metropolitan areas), between 45% and 50% of all renters could not afford a two-bedroom unit.

The unaffordability of housing is particularly acute for Connecticut’s low-income households. In 2009, the minimum income required to rent a two-bedroom unit (for a two-person household) in Connecticut ranged from a low of 186% of the Federal Poverty Level (Windham County) to a high of 329% (Danbury) and 372% of Poverty Level (Stamford/Norwalk).

Shelter Affordability by Selected Metropolitan Areas (2006 & 2009)  
(Connecticut)

	Renters Unable to Afford 2-BR Unit (2009)	Income Need to Afford 2-Bedroom Unit (2009) /a/ /b/		Income Needed to Afford 2-Bedroom Unit (2006) /a/ /b/	
		Dollars	Pct FPL	Dollars	Pct FPL

SOURCE: National Low-Income Housing Coalition, Out of Reach (annual)

NOTES:

/a/ Federal Poverty Level needed to rent 2 BR and 3 BR units calculated using NLIHC data.

/b/ The number of household members used in calculating Federal Poverty Level is equal to the number of bedrooms plus 1.

Energy costs and shelter costs march hand-in-hand in any discussion of “affordability.” The energy (and other utility) costs associated with housing are one component of the overall “rent” that is used to determine “housing affordability.” Fair Market Rents (FMRs), published annually by the U.S. Department of Housing and Urban Development (HUD) include all utility costs (except telephone). One aspect of the overall unaffordability of the rents presented above is the unaffordability of the underlying home utility costs.

Moreover, the unaffordability of shelter also impedes a lower-income household’s ability to respond to high energy costs. Not only do high shelter costs force low-income households into lower quality housing units, but they also divert resources that might otherwise be available to invest in cost-effective energy usage reduction measures. When households cannot afford to pay their basic shelter costs, they do not “invest” money in measures to save energy, even if those measures might generate even a moderate-term payback.

### HOUSEHOLD RESPONSES TO ENERGY UNAFFORDABILITY

The implications of the unaffordability of home energy in Connecticut are sobering. The unaffordability of energy manifests itself in more than simply unpaid bills. According to the

National Energy Assistance (NEA) survey published by the National Energy Assistance Directors Association (NEADA),<sup>8</sup> “despite. . .significant residential energy expenses, most low-income households pay their energy bills regularly. But at what cost?”. The NEA survey found that “LIHEAP recipients faced life-threatening challenges.”

- 17% of the national respondents had their heating disconnected or discontinued because of an inability to pay.
- 8% had their electricity (as opposed to heating) disconnected due to an inability to pay.
- 38% went without medical or dental care in order to have money to pay their home energy bill;
- 30% went without filling a prescription or taking the full dose of a prescribed medicine.
- 22% went without food for at least one day.

Low-income customers frequently have little incentive, and even fewer choices, to pursue constructive responses to their energy poverty. Enrolling in an energy efficiency program to reduce high bills on a going-forward basis, for example, does not help pay an existing arrearage unless coupled with a reasonable long-term deferred payment plan. Conversely, agreeing to a deferred payment arrangement does not address affordability on a going-forward basis unless some adjustment can be made that either affects the level of the current bill or the level of household resources available to pay the current bill going forward.

All too frequently, the customer is faced with an immediate need (*e.g.*, bill payment by a date certain) with the available constructive responses to an inability-to-pay unable to deliver assistance either in the form, the time period, or the magnitude necessary to meet that need.

In this era of tight budgets and financial cutbacks for social services programs, it may seem unrealistic to recommend that society direct increased funding to help alleviate a poverty-related need. Nonetheless, it would be irresponsible to fail to acknowledge that the primary means to address the unaffordability if low-income home energy bills involves money.

#### **INCREASING FUNDING FOR BILL PAYMENT ASSISTANCE PROGRAMS**

Funding for bill payment assistance programs may come from three major sources:

- The federal government, through the Low-Income Home Energy Assistance Program (LIHEAP);
- The state government, through utility-funded universal service or public benefits programs; and

---

<sup>8</sup> Apprise, Inc. (April 2004). *National Energy Assistance Survey Report*, National Energy Assistance Directors Association: Washington D.C.

- The private sector, through private charitable crisis-intervention funds, known as fuel funds.

Each will be separately discussed below.

### ***Funding for LIHEAP***

The full nationwide Home Energy Affordability Gap was calculated to reach nearly \$34.2 billion in 2008.<sup>9</sup> Clearly, additional funding for LIHEAP would reduce the energy burdens experienced by low-income households. But how much would our nation need to spend to provide sufficient funding to serve all low-income households in need? “A definition of full funding,” one research organization has said, “depends on defining the level of assistance to individual families which is adequate, effective, and/or appropriate. The cost of meeting that level, or a defined share of it, for a target population will allow a determination of the resources needed in LIHEAP.”<sup>10</sup> The need should be determined by what funding it takes to reduce energy burdens, as a percentage of income, to an affordable level.<sup>11</sup>

### ***State Public Benefits Programs***

One of the most effective low-income fuel assistance program structures outside LIHEAP involves the delivery of rate affordability assistance through public utilities. While clearly not all low-income households use utility fuels such as natural gas and electricity as their primary heating source, nonetheless, the existence of electricity is nearly universal and the combination of gas and electric heating covers a substantial proportion of low-income households in Connecticut. A variety of program designs, target populations, and justifications exist for the utility programs that operate around the nation. The experience from these programs merits their emulation in Connecticut.<sup>12</sup>

The Pennsylvania Customer Assistance Program (CAP) represents an exemplary comprehensive statewide effort on the part of utilities to address the payment problems of their low-income households. Under the 1990 Pennsylvania Public Utility Commission (PUC) order directing the establishment of CAPs by both electric and gas utilities, affordable rate programs were to be directed toward income-eligible payment-troubled customers.

The Pennsylvania CAP programs were directed to be implemented by a 1992 Pennsylvania Public Utility Commission order. That order, titled *Policy Statement on Customer Assistance Program (CAP)*,<sup>13</sup> found that “CAPs provide alternatives to traditional collection methods for low-income,

<sup>12</sup> A comprehensive multi-state, multi-sponsor review of ratepayer-funded home energy affordability programs can be obtained at [www.appriseinc.org](http://www.appriseinc.org) (click on “multi-sponsor study—July 2007”).

<sup>13</sup> Docket M-00920345 (July 2, 1992).

payment troubled customers. Generally, customers enrolled in a CAP agree to make monthly payments based on household family size and gross income. These regular monthly payments, which may be for an amount that is less than the current bill, are made in exchange for continued provision of utility service." The PUC concluded: "as a result of our investigation, the Commission believes that an appropriately designed and well implemented CAP, as an integrated part of a company's rate structure, is in the public interest. These guidelines prescribe a model CAP which is designed to be a more cost effective approach for dealing with issues of customer inability to pay than are traditional collection methods."

Other state universal service programs include:

- New Hampshire's Electric Assistance Program (EAP), operating as a "tiered discount" program;
- New Jersey's Universal Service Fund (USF), operating as a "fixed credit" program;
- Maryland's Electric Universal Service Program (EUSP), operating as a LIHEAP supplement program; and
- Indiana's Universal service Programs (USPs), operating as a tiered rate discount program.

A variety of other states (Ohio, Illinois, Wisconsin, Colorado, Oregon, California) also operate public benefits programs that provide rate affordability assistance.<sup>14</sup>

### ***Fuel Fund Funding***

Connecticut fuel funds are among the most successful in the country. Operation Fuel is a nationally-recognized leader in the provision of charitable crisis energy assistance.

Public utilities should recognize the benefits of engaging in aggressive fundraising efforts to assist local fuel funds. Fuel funds are local agencies that provide charitable energy assistance, generally to prevent the disconnection of service for nonpayment. Aggressive fundraising can occur in at least the following ways:

- Utilities can engage in direct outreach to their customers on a periodic basis. Many utilities provide fuel fund solicitation no fewer than four times a year, at least one of which is not a bill insert.
- Utilities can seek to enroll customers in regular contribution programs rather than merely seek one-time contributions. Program enrollment involves customers

---

<sup>14</sup> The National Consumer Law Center, in Boston, maintains an up-to-date list of public benefits programs. Because such a list is so constantly changing, one is not included in this publication. An analysis of "best practices" within ratepayer-funded rate affordability programs was recently prepared for Hydro-Quebec. Roger Colton (November 2007). *Best Practices: Low-Income Rate Affordability Programs: Articulating and Applying Rating Criteria*, Fisher, Sheehan & Colton: Belmont (MA).

agreeing to donate on a regular basis through a line-item on the bill. Once enrolled, the participation continues until the customer asks to be un-enrolled.

- Utilities can solicit customers to donate refunds or other rebates provided by the utility. This refund might involve excess earnings sharing of a utility operating under an earnings cap, refunds of interim base rate increases collected under bond subject to refund, gas pipeline refunds, or other money directed back to the customer. Donations of rebates offered through energy efficiency programs, for example, as well as donations of customer capital distribution by Rural Electric Cooperatives (RECs) can be sought. The Colorado Energy Assistance Foundation (now Energy Outreach Colorado) found that because customers often view refunds as “found money,” the rate of customers contributing, as well as the level of giving per customer, are up to four times higher with such donations than with normal solicitations.
- Utilities can adopt fuel fund contribution mechanisms to be used during on-line payment. As an increasing number of customers move to on-line payment of bills, the proportion of contributions decreases in the absence of a specific on-line contribution mechanism. A mandatory fuel fund contribution screen, requiring a person to make an affirmative choice about whether or not to contribute, is a useful mechanism.

Each utility company’s activities can be evaluated against other national utilities to determine whether its fuel fund solicitations are generating funds at a rate and level that is consistent with those of best practice utilities. Appropriate benchmarking includes fuel fund contributions on a dollars-per-customer basis as well as on a contribution-as-percent-of-residential-revenue basis. Where the utility company’s fuel fund contributions are shown through such an evaluation to have fallen short, the company should develop specific plans on how to modify its fuel fund solicitation process.<sup>15</sup>

### ***Additional Actions not Considered***

Generating additional funding for bill assistance is certainly not the only needed energy assistance. Weatherization, for example, can be an effective tool to use in reducing low-income energy needs for many, but not all, households. Weatherization improves affordability by increasing the efficiency of energy usage and thus decreasing energy bills.

Like fuel assistance, however, weatherization has limitations to its effectiveness. It is inadequately funded. Federal Weatherization Assistance Program (WAP) dollars will never be adequate to provide services to all eligible low-income homes needing weatherization within a reasonable period of time.

It must be remembered that the Home Energy Affordability Gap study found that Connecticut has more than 50,000 households living with income below 50% of the Federal Poverty Level.

---

<sup>15</sup> The primary source of information on fuel funds is the National Fuel Funds Network (NFFN). NFFN information can be accessed at its World Wide Web site: <http://www.nationalfuel funds.org>.

An additional 25,000 live with incomes between 50% and 75% of Poverty, while 30,000 more live with incomes between 75% and 100% of Poverty. As can be seen, even limiting consideration to households below Poverty Level, even if WAP were to reach thousands of low-income homes each year in Connecticut, it would be decades before all eligible homes could be treated. Weatherization makes only a small dent in the statewide needs of low-income households.

In addition, for some households with very low-incomes, no amount of weatherization will be able to bring their bills low enough to be an affordable energy burden. The energy poverty crisis facing low-income households is not a problem that can be addressed by increasing weatherization funds alone. The home energy burdens faced by low-income households are not simply a function of high energy bills, but instead are a function of the interplay between energy bills and income. While weatherization unquestionably plays an important role in helping to address energy poverty issues, and funding should be maintained if not expanded, weatherization alone would be inadequate to redress the mismatch between household home energy expenses and household resources available to pay those expenses.

Finally, issues such as regulatory protections through processes such as payment plans, extreme weather protections (such as hot and cold weather shutoff moratoriums), the impacts of current efforts to impose miscellaneous fees (such as field collection charges and service connect charges) have been set aside not because they are unimportant, but rather because it is impossible to comprehensively address such issues in this report.<sup>16</sup>

---

<sup>16</sup> Persons interested in such issues can access information through organizations such as the National Consumer Law Center (<http://www.consumerlaw.org>), the National Fuel Funds Network (<http://www.nationalfuel funds.org>), and Fisher, Sheehan & Colton (<http://www.fsconline.com>).
